

In this lesson, I learned about the basic concepts and skills related to the internet. The internet is a global system that connects many different computer networks. These networks allow computers, phones, and other devices to communicate with each other worldwide. I learned that the internet uses a set of communication rules called TCP/IP to help devices communicate and share information. I also learned about some important basic computer skills that are useful when using the internet. These skills include typing, navigating a computer, managing files, browsing the web, and using email. Being able to organize and manage files is important because it helps keep information easy to find and access. Web browsing is another important skill because it allows people to search for information, visit websites, and communicate with others online.

The lesson also explained that online systems and communication are an important part of using the internet. Email, websites, and other online services allow people to exchange information quickly. I learned that text editors and word processing software are also useful computer tools because they allow users to create, edit, and organize written information. Overall, this lesson helped me understand that the internet is more than just websites and social media. It is a large network of connected devices that relies on specific technologies and communication protocols. I also learned that having strong basic computer skills makes it easier to use the internet effectively. These fundamentals will be useful in the course and in everyday life. I think understanding these concepts is especially important for someone studying information technology because they provide a foundation for learning more advanced computer and networking topics.
